USER INTERFACE DESIGN – EXPERIMENT 9
FORM VALIDATION USING HTML, CSS AND JAVASCRIPT

Name: Sangamithra Arun
Roll No: 240701465
Course: USER INTERFACE DESIGN

AIM

The aim of this experiment is to design an input form and validate user data such as email and phone number using HTML, CSS, and JavaScript, and to display appropriate error messages for invalid inputs.

PROCEDURE

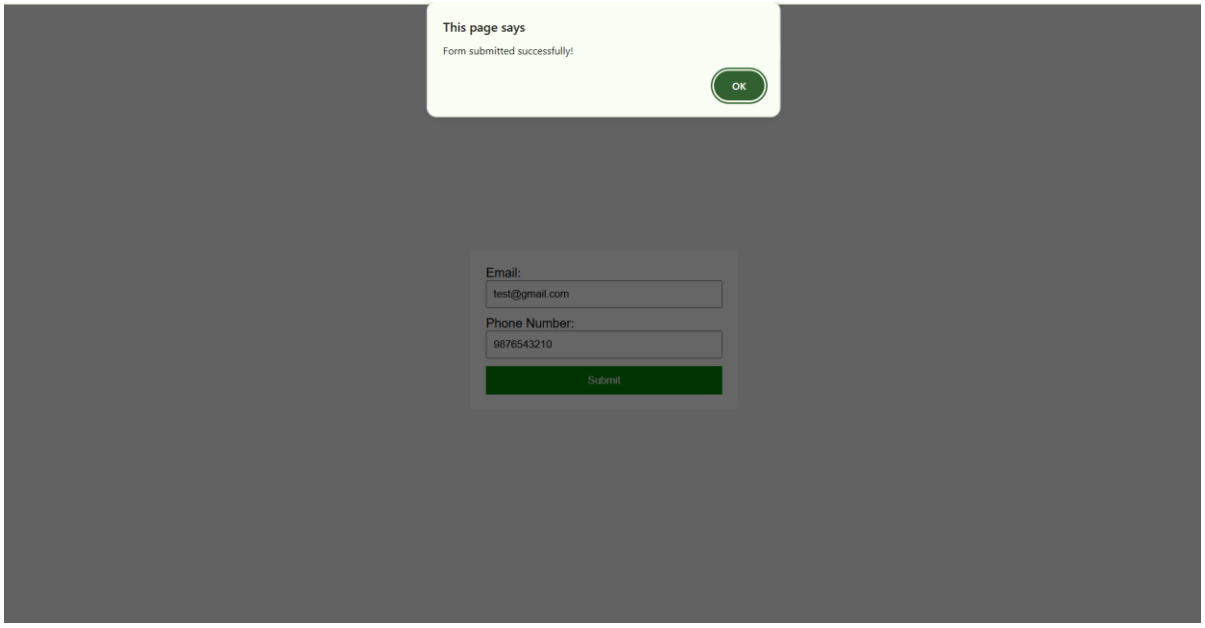
An HTML form was created with input fields for email and phone number. Labels were added to clearly indicate each field, and span elements were included to display validation error messages. The form was styled using CSS to improve its layout, alignment, and overall appearance, ensuring a clean and user-friendly interface. JavaScript was then implemented to validate the user inputs by checking whether the entered email and phone number follow the correct format using regular expressions. The script was designed to prevent form submission when invalid data is entered and to display appropriate error messages below the respective fields. When valid data is entered, a success message is displayed indicating successful submission.

OUTPUT DESCRIPTION

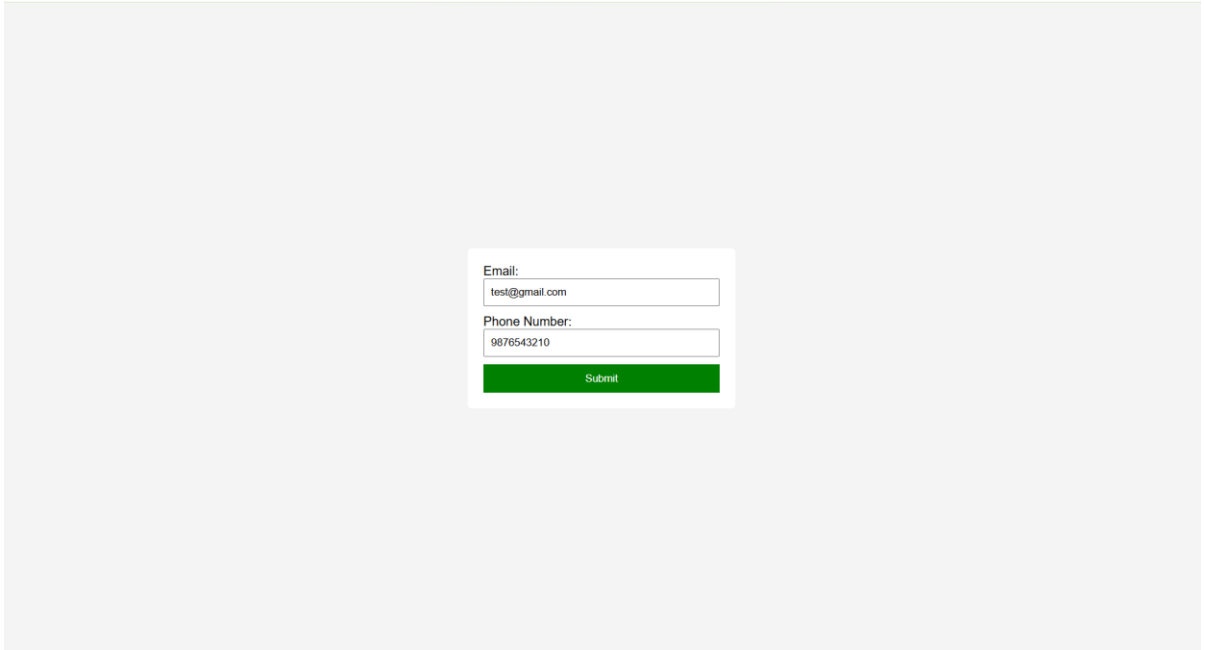
The form is displayed at the center of the screen with clearly labeled input fields for email and phone number along with a submit button. When valid input values are entered, the system displays a success message confirming that the form has been submitted successfully. When invalid data is entered, appropriate error messages such as “Invalid Email” and “Invalid Phone Number” are displayed below the respective input fields, guiding the user to correct the input.

RESULT

Thus, the form validation system was successfully implemented using HTML, CSS, and JavaScript. The system effectively validates user input and provides appropriate feedback for both valid and invalid entries, ensuring improved user interaction and data accuracy.



This page says
Form submitted successfully!
OK
Email:
test@gmail.com
Phone Number:
9876543210
Submit



Email:
test@gmail.com
Phone Number:
